

## CONVERTING FROM CMYK TO RGB IN COREL DRAW

Congratulations on the purchase of your new ArTainium or SubliJet-R dye-sublimation ink system. The system uses an ICC profile to create the See-It, Print-It solution that has won several awards. The profile uses the RGB colour space, which means that artwork created in CMYK colour space needs to be converted to RGB for printing colours correctly.

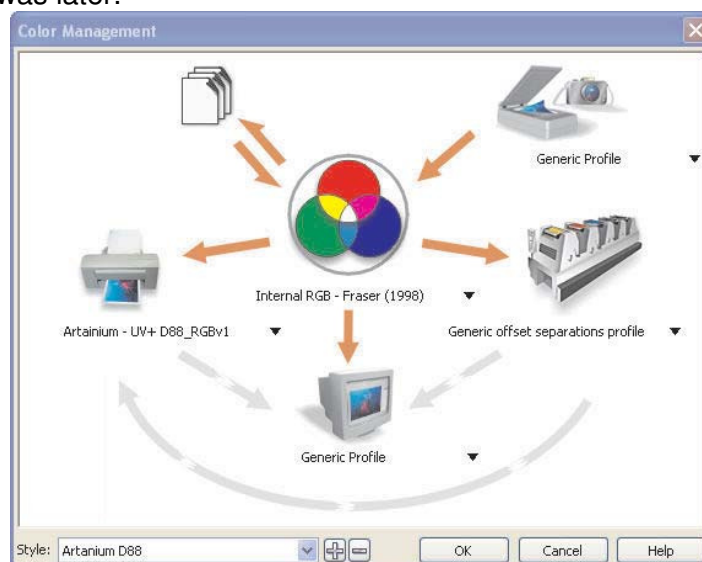

The Find and Replace option in CorelDraw makes this a relatively simple task providing the colour management is set to off when doing so. For instance 100% black in CMYK colour mode should convert to zero of each RGB in that colour space. With colour management switch on the 100% Black can end up with a value of R-36, G-32, B-29 which will not sublimate as desired. This is caused by Corel's colour management applying colour profile data with colour management switched on.

**To switch Corel's Colour Management off** – open the Colour Management Options window by selecting: Tools – Colour Management.

Note: You must have an image or blank page on-screen to select this option.

If you have a non-standard colour management setting you should click the plus sign and save them under a meaningful name if not already saved. This will make it easy to reset it back to the way it was later.

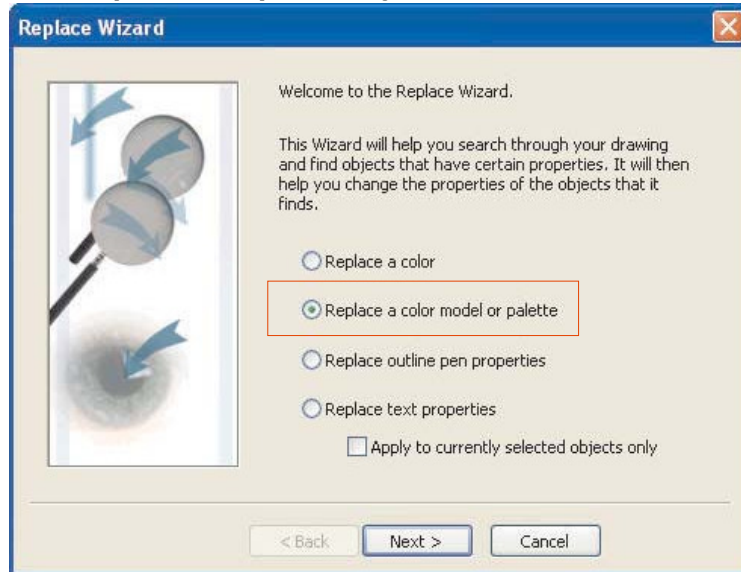

All products are supplied for professional use and to be used in conjunction with the Transfer Instructions provided. Power Digital is not liable for any pressing errors or undesired results. The Transfer Instructions are to be used as a guide only as different stock, hardware and environmental factors can affect the outcome. Contact our technician if you have any queries.
